# Chapter 1

## Introduction

The *tikz* package is used when we want to draw some diagrams in L<sup>A</sup>T<sub>E</sub>X.

In order to use it, we first need to include it using the `\usepackage{}` command like so:

Listing 1.1: Format

```
\documentclass{.....}
....
....
....
\usepackage{tikz}
....
....
....
```

To be able to draw using this package, we need to use an environment called `tikzpicture` like so:

Listing 1.2: Syntax

```
\begin{tikzpicture}
% write your code here
\end{tikzpicture}
```

### 1.1 Drawing a simple line

To draw a simple line, use the following command:

Listing 1.3: Draw a simple line

```
\begin{tikzpicture}
    \draw(0,0)--(3,3);
\end{tikzpicture}
```

The dashes `--` between `(0,0)` and `(3,3)` indicate that we want a line.

**NOTE:** Don't forget the *semicolon* ;

Here's the [Code](#).

Here's the [Output](#).

### 1.2 Drawing zig-zag lines

Now, we will use the same code that we used in **Drawing a simple line**, but will be longer now.

Listing 1.4: Draw a zig-zag line

```
\begin{tikzpicture}
  \draw(0,0)--(1,1)--(2,0)--(3,1)--(4,0)--(5,1)--(6,0);
\end{tikzpicture}
```

Here's the [code](#).

Here's the [output](#).

Notice the *semicolon* being used at the end.

## 1.3 Drawing triangle

A triangle is a closed figure, so we need to use an extension `--cycle` to close the figure. Basically it will draw a line from the last coordinate to the first coordinate, thus adding the last side to the figure.

Listing 1.5: Draw a triangle

```
\begin{tikzpicture}
  \draw(0,0)--(3,0)--(3,3)--cycle;
\end{tikzpicture}
```

Notice that we first join (0,0) with (3,0) and then we join (3,0) with (3,3). Finally, we use `--cycle` to join (3,3) with (0,0) which eventually forms a triangle.

Here's the [code](#).

Here's the [output](#).
