## Chapter 1

## Introduction

The *tikz* package is used when we want to draw some diagrams in LATEX.

In order to use it, we first need to include it using the the \usepackage{} command like so:

To be able to draw using this package, we need to use an environment called tikzpicture like so:

```
\begin{tikzpicture}
% write your code here
\end{tikzpicture}
```

#### 1.1 Drawing a simple line

To draw a simple line, use the following command:

```
 \begin{array}{l} \left\langle \operatorname{begin} \{\operatorname{tikzpicture} \} \right\rangle \\ \left\langle \operatorname{draw} (0\,,0) - - (3\,,3); \right\rangle \\ \left\langle \operatorname{tikzpicture} \right\rangle \end{array}
```

```
The dashes -- between (0,0) and (3,3) indicate that we want a line. NOTE: Don't forget the semicolon; Here's the Code. Here's the Output.
```

### 1.2 Drawing zig-zag lines

Now, we will use the same code that we used in **Drawing a simple line**, but will be longer now.

```
 \begin{array}{l} \langle \operatorname{begin}\{\operatorname{tikzpicture}\} \\ \langle \operatorname{draw}(0,0) - -(1,1) - -(2,0) - -(3,1) - -(4,0) - -(5,1) - -(6,0); \\ \langle \operatorname{end}\{\operatorname{tikzpicture}\} \end{array}
```

Here's the code.

Here's the output.

Notice the *semicolon* being used at the end.

#### 1.3 Drawing triangle

A triangle is a closed figure, so we need to use an extension --cycle to close the figure. Basically it will draw a line from the last coordinate to the first coordinate, thus adding the last side to the figure.

```
\label{eq:continuous} $$ \begin{array}{c} \left( \text{tikzpicture} \right) \\ \left( \text{draw}(0,0) - -(3,0) - -\text{cycle} \right) \\ \left( \text{end} \left\{ \text{tikzpicture} \right\} \end{array} \right) $$
```

Notice that we first join (0,0) with (3,0) and then we join (3,0) with (3,3). Finally, we use --cycle to join (3,3) with (0,0) which eventually forms a triangle.

Here's the code.

Here's the output.
